WORK EXPERIENCE

Product Engineer at Apple Developer Academy, BINUS Tangerang

March 2026 - Now

- **SonAR** (ARKit, RealityKit, Vision): traced device overheating to per-frame recursive entity cloning (100+ clones per second at peak) and replaced it with a pre-allocated entity pool driven by a RealityKit ECS **System**, covered by a unit test; validated raycast distance on non-LiDAR devices with a feasibility POC before the full build, and fixed Vision material detection by ranking the top five candidates instead of trusting the first
- **Scouters** (CloudKit, CoreLocation, App Intents): built parent-child location sharing with no custom backend using CKShare, and moved geofencing to OS-level **CLCircularRegion** monitoring because polled location fixes lag and cause missed exits or false alarms; exposed parent actions as App Intents that run without opening the app
- **Presently** and **CapyRun**: generated tone-matched reminder copy on-device with Apple's Foundation Models, using structured output so the app receives typed Swift data instead of free text and no user data leaves the phone; built a guided 6-week 5K training app with HealthKit, CoreMotion, and WidgetKit

Software Engineer at Bayarind Artha Internusa

October 2024 - February 2026

- Built a payment gateway that follows the SNAP standard and integrates a third-party payment provider, in a microservices architecture
- Designed an event-driven system with NATS and Elasticsearch that records the success or failure of each transaction, so incidents can be traced from one place instead of across service logs
- Maintained an authentication service with gRPC-based encrypted communication between payment services
- Migrated the core payment integration codebase from PHP to Go and built a payment linkage service to integrate client wallet apps

Frontend Software Engineer at Dinas Pendidikan Kota Surabaya

January 2022 - July 2023

- Built responsive, performance-focused web applications with React, Next.js, TypeScript, and Redux across multiple projects
- Managed shared design systems and resolved frontend bugs in large-scale software integrated with a Laravel backend
- Collaborated closely with design and backend teams to ship features across the platform

Backend Engineer Intern at Lingotalk

October 2022 - December 2022

- Built gamification service APIs (points, streaks, achievements) in NestJS/TypeScript on FaunaDB, using event-sourced state and idempotent unlocks so streaks stay correct when many events arrive at once
- Designed a microservice architecture and deployment tooling
- Diagnosed and resolved backend bugs to improve code efficiency

EDUCATION

Bachelor (Computer Science) at Sepuluh Nopember Institute of Technology

2020 - 2024

Focus: Software Engineering, Data Structures & Algorithms, Software Design & Architecture, Distributed Systems & Cloud Computing, Information Security, Database Systems

Thesis: *Double Track Recommendation System*, a TOPSIS-based ranking algorithm (Go, Next.js/TypeScript) reaching 85.5% accuracy, built for East Java's government-backed Double Track program

Final Project (Information Security): a client-server chat app implementing symmetric (DES) and asymmetric (RSA) cryptography in Python

SKILLS

Apple	Swift, SwiftUI, UIKit, CloudKit, ARKit/RealityKit, App Intents, Foundation Models
Languages	Go, TypeScript, JavaScript, Swift, C++, Java, Kotlin
Frameworks	NestJS, React, Next.js, ElectronJS
Infrastructure	Docker, Kubernetes, gRPC, NATS, PostgreSQL, MongoDB, FaunaDB, Redis, Elasticsearch, Git
Tools	Claude (Anthropic), MCP
